## HOW TO INSTALL COLOUR PROFILES

Most devices already have the **sRGB** colour profile pre-installed and can understand it (however it is available to download at: http://www.color.org/srgbprofiles.xalter (select v2 not v4)).

**EciRGBv2** isn't installed as standard on computers as it is a relatively new colour profile in comparison with the more commonly used Adobe's **AdobeRGB1998** profile. So before you properly viewing these images you'll need to make sure that it's installed on your computer, It can be downloaded from the European Color Initiative's website: http://www.eci.org/_media/downloads/icc_profiles_from_eci/ecirgbv20.zip?id=en%3Adownloads&cache=cache . To make things easier we've supplied the profile **EciRGBv2.icc** here along with your images

N.B. Although one can look at the the images on computers/devices without the profile installed, for colour critical viewing and image editing one should definitely have it installed.

For installation;

**MAC OS X**

Copy the ICC profile files to the **\Users\Library\ColorSync\Profiles** folder.  Profiles installed in this location will be available only to the user who installed the profiles.
or
Copy the ICC profile files to the **\Library\ColorSync\Profiles** folder. Installing in this location requires the user to be an administrator of the system. Profiles installed in this location will be available to all users.

**WINDOWS**

Select the profile, click and hold the right mouse button and choose the **'Install Profile'** menu item.

**Please remember when distributing the large version image files to either include the relevant ICC profile file or direct the recipient to the relevant website.**
